- A. My first opinion is that the IAS solar dish system has not produced any electricity or any other useful form of energy from sunlight.
 - Q. Why do you think that?
- A. I never saw anything operating. It's a series of components that, once I analyzed them, really don't fit together into a system that will operate efficiently or effectively at all.
- Q. What, if anything, in the documents or other materials you reviewed suggested that electricity or other usable energy had ever been produced?
 - A. Nothing.
- Q. In your experience, Dr. Mancini, how would the event of producing power be reflected in the documents of a typical concentrating solar power plant?
- A. Well, when a plant is commissioned, that's a big deal. Even first production of electricity is a big deal. It would be -- it would be an event of some sort typically.
- Q. And what, if any, data would you typically see to reflect the production of any power whatsoever?
- A. Well, it would be a big deal to show power going on the grid, and they would probably report that.
- Q. Did you see any such documentation in the materials you reviewed?

11:00:45 1 the sun, what happens? 11:00:47 2 11:00:50 3 won't be on the receivers. 11:00:54 4 11:01:06 5 11:01:09 6 11:01:15 sun? 7 11:01:16 11:01:19 11:01:23 10 11:01:27 11 11:01:31 12 11:01:35 13 automatically. 11:01:36 14 11:01:38 15 11:01:41 16 11:01:43 17 THE COURT: Okay. 11:01:46 18 11:01:48 19 THE WITNESS: Yes. 11:01:49 20 11:01:53 21 11:01:58 22 11:02:02 23 11:02:07 24 11:02:13 25 the field to supply each receiver, four inlet pipes on

Well, then the image won't fall at the focal point or at the region where you want it to be, so it At any time on your site visit, Dr. Mancini, did you see any of the collectors automatically tracking the No, ma'am. There were only two. On each visit there was one collector moved. During the first visit it moved only in azimuth, and during the second visit they had both an elevation and an azimuth on that collector, but they were both moved manually. I saw none track THE COURT: When you talk about a collector, are you speaking about a single lens or a group of lenses? THE WITNESS: The group of all four circular ones. This whole unit makes a collector. MS. HEALY-GALLAGHER: All right. So, assuming that the collector plane were perpendicular to the sun, where would the light and heat from the sun go? Well, the receivers would be illuminated, purportedly, and then you'd have to have I-beam throughout 11:35:14 1 11:35:17 2 11:35:20 3 11:35:24 4 11:35:39 5 11:35:43 6 11:35:45 7 11:35:49 11:35:53 9 11:35:56 10 11:36:00 11 11:36:05 12 11:36:08 13 11:37:14 14 11:37:19 15 11:37:20 16 11:37:38 17 11:37:40 18 11:37:44 19 11:37:46 20 11:37:50 21 11:37:57 22 11:38:02 23 11:38:04 24 11:38:08 25

me if I'm wrong -- but the power lines that we see on the two poles on the right-hand side of this image just couldn't accept the amount of power that Mr. Johnson is proposing to put on them?

- A. That's correct.
- Q. You discussed the need for a substation. Could you talk a little bit more about what a substation is?
- A. Well, power projects typically produce large amounts of power, so you take that into a local distribution. Now, Mr. Johnson did refer to a substation down the line that he could potentially connect to, but I didn't see any -- any efforts to make that connection or any indication that that had been done.

MS. HEALY-GALLAGHER: May I have just one moment Your Honor?

THE COURT: Yes.

- Q. BY MS. HEALY-GALLAGHER: Dr. Mancini, I'd like to move on to the reasons that support your second conclusion in this case. Would you please remind the Court of your second opinion or conclusion in this case?
- A. It's my opinion that the IAS solar technology will never be a commercial solar energy system producing electrical power or any other form of useful energy.
- Q. And what are the two primary reasons for that conclusion?

- 11:38:08 1 11:38:13 2 11:38:17 3 11:38:25 4 11:38:29 5 11:38:34 6 11:38:40 7 11:38:46 8 11:38:50 9 11:38:55 10 11:39:07 11 11:39:11 12 11:39:18 13 11:39:22 14 11:39:25 15 11:39:30 16 11:39:35 17 11:39:39 18 11:39:43 19 11:39:47 20 11:39:52 21 11:39:56 22 11:39:58 23 11:40:00 24 11:40:05 25
- A. The two primary reasons are, first of all, the components are just a series of components. They don't really fit together as a system that will -- will make a commercial grade solar energy system. And the second is that the -- probably, one of the major underpinnings for all of my conclusions here are that the resources, both in intellectual capacity in terms of training and background and in terms of sheer numbers of people working on this project are not sufficient to produce or develop a commercial system.
- Q. All right. Dr. Mancini, let's talk first about resources and people. What kind of staff, Dr. Mancini, does it take to bring a concentrating solar power project to commercial viability?
- A. Well, you would have numbers of engineers working at the manufacturing facility and technicians. You'd have engineers that are mechanical engineers, that are structural, focused on dynamic structures. You'd have electrical engineers and power engineers. You'd have chemists and metallurgists. You'd have systems engineers helping you make sure that you address issues relating to how the system fits together.

Then, if you go to the test site, you'd have to have test engineers testing various pieces of equipment, and you'd have to have people doing the actual

1 And there were electrical wires lying in pools of dirty. 2 water. Fortunately I don't think they were energized at the 3 time. But the side just didn't appear that it was really an active site or had been really used in some time. 4 And how does that compare with other concentrating 13:53:14 5 6 solar power projects that you've been a part of that have been 7 in testing or research development or operation? 8 They're very different. They're very different. Α. 9 How so? Q. 13:53:29 10 Α. 11

A. Well, there's a lot of activity. There's things being tested. You're testing either components because you had to redesign it to make it more manufacturable, so you're testing the new components to see if it's going to operate, if it's going to operate a long time. I didn't see any testing going on at all. There's just -- it just seemed to be a site of inactivity to me.

- Q. Having seen all of these things that indicate the components, the defendant's components don't work together in a system, what do they mean to you with respect to whether the purported IAS solar energy technology is commercially viable?
- A. Well, certainly as it's currently represented, it's, in my opinion it will never be a commercial system or will ever produce electricity or any other useable form of energy.

MS. HEALY-GALLAGHER: May I take a moment, Your
